

# Spectroscopy of correlated electrons in nickelates and titanates

Metal-insulator transitions and novel 2DEGs

Dan Ouellette

Dept. of Physics

University of CA, Santa Barbara

UCSB

# Strong Electron Correlations

- ▶ Materials which depart from our “typical” description of solids.
- ▶ Phenomena that cannot be described by single electron physics.

# Starting point of Solid State Physics

Atoms:

- Orbitals
- Discrete energies

Solids:

- Bloch states
- Continuous energy bands
- Energy gaps

# Starting point of Solid State Physics

---

- ▶ Calculate the energy bands
- ▶ Single particle physics within a band
  - “Band” mass

# Starting point of Solid State Physics

- ▶ Calculate the energy bands
  - ▶ Single particle physics within a band
- “Band” mass

# Starting point of Solid State Physics

- ▶ Calculate the energy bands
  - ▶ Single particle physics within a band
- “Band” mass

# But don't the electrons interact?

---

## Accounting for e-e interactions

- Density functional theory
  - Replace quantum interactions with average density to obtain energy bands
  - Then consider single electron dynamics in these bands...
- Confined semiconductor structures
  - Schrodinger-Poisson

**VERY SUCCESSFUL**

**What if the motion of the electrons is inherently collective?**

# Example: The Hubbard Model

**A partially filled band is metallic.**

$$H = \sum_{i,\sigma} \epsilon_i n_{i\sigma} + \sum_{ij\sigma} t_{ij} c_{i\sigma}^\dagger c_{j\sigma}$$

N. F. Mott (1949, 1956, 1977, 1978), Hubbard (1964)

Kamimura and Aoki "The Physics of Interacting Electrons in Disordered Systems" Oxford 1989

# Example: The Hubbard Model

$$H = \sum_{i,\sigma} \epsilon_i n_{i\sigma} + \sum_{ij\sigma} t_{ij} c_{i\sigma}^\dagger c_{j\sigma} + U \sum_i \hat{n}_{i\uparrow} \hat{n}_{i\downarrow}$$

N. F. Mott (1949, 1956, 1977, 1978), Hubbard (1964)

Kamimura and Aoki “The Physics of Interacting Electrons in Disordered Systems” Oxford 1989

# 2DEG at the interface

---

Pouya Moetakef *et. al.* APL **98** 112110 (2011)

# Where is this 2DEG?

Mobility and interface scattering suggest confinement to within a few nm of interface.

Pouya Moetakef *et al.* APL **98** 112110 (2011), Pouya Moetakef *et al.* *in press*

# Optical response

---

- ▶ More information from frequency dependent transport!

Conductivity in the plane: Drude like?

$$\sigma(\omega) = \frac{ne^2\tau/m}{1-i\omega\tau}$$

Out-of plane? Couple to intersubband transitions and plasmons?

# Optical properties of solids

## Drude Model

$$\sigma(\omega) = \frac{ne^2\tau/m}{1-i\omega\tau}$$

## Sum Rule

$$\frac{2}{\pi} \int_0^{\infty} \sigma_1(\omega) d\omega = \frac{ne}{m}$$

More general than Drude Model!

Frequency dependent conductivity:

Drude (free carriers), interband transitions, phonons, polarons,...

Dielectric polarizability:

$$\epsilon(\omega) = \epsilon_{\infty} + \frac{i\sigma(\omega)}{\omega}$$

Index of refraction and absorption coefficient

$$\tilde{n}(\omega) = n(\omega) + i\frac{c\alpha(\omega)}{2\omega} = \sqrt{\epsilon(\omega)}$$

# Bandwidth control using epitaxial strain

# Optical reflectivity in FTIR

Substrate matters! Optical penetration  $\gg$  film thickness

## Direct inversion

- Model independent
- Impose Kramers-Kronig consistency
- Substrate artifacts remain

# Optical conductivity of strained $\text{LaNiO}_3$

D. G. Ouellette *et al.* Phys. Rev. B  
**82** 165112 (2010)

In collaboration with  
SungBin Lee, Leon Balents,  
and Andy Millis (Columbia)

Carrier mass is renormalized by strong correlations not included in band theory.

# Strain control of bandwidth

**Optical mass, quadratic and linear** contributions to resistivity show similar strain dependence.

Tensile strain reduces hopping, i.e. bandwidth, increasing the importance of electron correlations

D. G. Ouellette *et al.* Phys. Rev. B **82** 165112 (2010)

# THz TDS: 30 nm $\text{LaNiO}_3$ /LSAT

- ▶ Very good agreement between reflectivity measurements in the FTIR, THz TDS transmission, and dc transport
- ▶ At 300 K, evidently the conductivity increases with frequency below 2 THz. Could be a phonon contribution?

# Summary: Rare-earth nickelates

---

## Results

- ▶ Strong electron correlations enhance the mass  $\sim$  threefold.
- ▶ Bandwidth control using epitaxial strain
- ▶ Zero-bias tunneling anomaly: disorder or correlations?
- ▶ Band offsets from internal-photoemission

## Outlook

- ▶ Modulated transport and absorption to study field effect in remotely doped  $\text{NdNiO}_3$ .
- ▶ Improved tunneling and internal photoemission measurements.

# Thank You!
